Amplified fragments were ligated into pTTQ18 vector, which contains the hybrid trp-lac (tac) promoter. An amplification/selection protocol was used to isolate clone 4B containing a mutated Taq DNAP gene (mutTag) (sequence given in AAQ80746) having normal 5' nuclease activity but less than 18 of the wt Taq DNAP activity. mutTaq was cut from pTTQ18 by EcoRI-SalI digestion and cloned into pET-3c. Thus clone was digested with BstXI and BamHI. The DNA was treated with DNAPECI Klenow fragment and dNTPs, blunt-ended and religated, resulting in an in-frame deletion of 903 nucleotides. The DNA sequence of the resulting 5' nuclease is given in AAQ80745.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .
